Claim Amendments

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims

- 1. (currently amended) A method for decreasing the appetite of a mammal comprising enterally administering to said mammal an amount of long-chain n-3 PUFA polyunsaturated fatty acid effective to decrease the appetite of said mammal, wherein the polyunsaturated fatty acid is administered in the form of a triacylglycerol.
- 2. (currently amended) The method according to claim 1 wherein said long-chain n-3 PUFA polyunsaturated fatty acid comprises DHA docosahexaenoic acid.
- 3. (currently amended) The method of claim 2 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered independent of [AA] arachidonic acid.
- 4. (currently amended) The method according to claim 1 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered during a growth phase prior to or in conjunction with an appetite-impacting stimulus.
- 5. (currently amended) The method according to claim 1 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered to an infant in a daily amount of about 8 to about 396 mg/kg body weight.
- 6. (currently amended) The method according to claim 1 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered to a child or an adult in a daily amount of about 84 to about 15,832 mg.
- 7. (currently amended) A method for modulating the appetite of a mammal comprising enterally administering to said mammal an amount of long-chain n-3 PUFA polyunsaturated fatty acid and an amount of long-chain n-6 PUFA polyunsaturated fatty acid in relative

amounts effective to modulate the appetite of said mammal, wherein the polyunsaturated fatty acids are administered in the form of a triacylglycerol.

- 8. (currently amended) The method according to claim 7 wherein said long-chain n-3 PUFA polyunsaturated fatty acid comprises DHA docosahexaenoic acid and said long-chain n-6 PUFA polyunsaturated fatty acid comprises [AA] arachidonic acid.
- 9. (currently amended) The method according to claim 7 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered during a growth phase prior to or in conjunction with an appetite-impacting stimulus.
- 10. (currently amended) The method according to claim 7 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered to an infant in a daily amount of about 8 to about 396 mg/kg body weight.
- 11. (currently amended) The method according to claim 7 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered to a child or an adult in a daily amount of about 84 to about 15,832 mg.
- 12. (currently amended) A method for antagonizing the CB₁ cannabinoid receptor in the brain of a mammal comprising enterally administering to said mammal an amount of long-chain n-3 PUFA polyunsaturated fatty acid effective to antagonize the CB₁ cannabinoid receptor activity in the brain of said mammal, wherein the polyunsaturated fatty acid is administered in the form of a triacylglycerol.
- 13. (currently amended) The method according to claim 12 wherein said long-chain n-3 PUFA polyunsaturated fatty acid comprises DHA docosahexaenoic acid.
- 14. (currently amended) The method of claim 12 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered independent of [AA] arachidonic acid.

- 15. (currently amended) The method according to claim 12 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered during a growth phase prior to or in conjunction with an appetite-impacting stimulus.
- 16. (currently amended) The method according to claim 12 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered to an infant in a daily amount of about 8 to about 396 mg/kg body weight.
- 17. (currently amended) The method according to claim 12 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered to a child or an adult in a daily amount of about 84 to about 15,832 mg.
- 18. (currently amended) A method for decreasing the incidence of obesity or overweight status in a population of mammals comprising enterally administering to at least some members of said population an amount of long-chain n-3 PUFA polyunsaturated fatty acid effective to modulate negatively the appetite of said mammal, wherein the polyunsaturated fatty acid is administered in the form of a triacylglycerol.
- 19. (currently amended) The method according to claim 18 wherein said long-chain n-3 PUFA polyunsaturated fatty acid comprises DHA docosahexaenoic acid.
- 20. (currently amended) The method of claim 18 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered independent of [AA] arachidonic acid.
- 21. (currently amended) The method according to claim 18 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered during a growth phase prior to or in conjunction with an appetite-impacting stimulus.
- 22. (currently amended) The method according to claim 18 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered to an infant in a daily amount of about 8 to about 396 mg/kg body weight.

- 23. (currently amended) The method according to claim 18 wherein said long-chain n-3 PUFA polyunsaturated fatty acid is administered to a child or an adult in a daily amount of about 84 to about 15,832 mg.
- 24. (currently amended) A method for increasing serum leptin levels of a human or other mammal, said method comprising administering to the human or other mammal an effective amount of a long-chain n-3 PUFA polyunsaturated fatty acid to increase postprandial serum leptin levels, wherein the polyunsaturated fatty acid is administered in the form of a triacylglycerol.
- 25. (currently amended) The method of claim 24 wherein the long-chain n-3 PUFA polyunsaturated fatty acid comprises DHA docosahexaenoic acid.
- 26. (currently amended) The method of claim 24 wherein the long-chain n-3 PUFA polyunsaturated fatty acid is administered to a child or an adult in a daily amount of from about 84 to about 15,832 mg.
- 27. (currently amended) A method for reducing the appetite of a human or other mammal, said method comprising administering to the human or other mammal an effective amount of long-chain n-3 PUFA polyunsaturated fatty acid to increase serum leptin levels, wherein the polyunsaturated fatty acid is administered in the form of a triacylglycerol.
- 28. (currently amended) The method of claim 27, wherein the <u>long-chain</u> n-3 PUFA <u>polyunsaturated fatty acid</u> comprises DHA <u>docosahexaenoic acid</u>.
- 29. (currently amended) The method of claim 27 wherein the long-chain n-3 PUFA polyunsaturated fatty acid is administered to a child or adult in a daily amount of from about 84 to about 15,832 mg.
